The right question is not “investor or trader?” The right question is “which capital job do I need solved?”
BTC and XRP solve different jobs. The bundle only makes sense when you want both jobs solved under one capital policy.

1. Which edge are you buying?

Default start path: BTC first. Add XRP only when your reserve-core plan already exists or when you deliberately want the cycle sleeve.

Capital job	Best fit	What you are buying
Improve long-run BTC ownership under the same recurring budget	BTC	A reserve-core deployment engine with matched-control proof, a deeper BTC proof path, contribution-fit guidance, and chapter continuity.
Capture rare high-impact XRP weeks and defend the top side without improvising	XRP	A cycle-state engine plus a Weekly Plan that turns bottoms, tops, and risk states into action.
Use XRP asymmetry without letting it hijack the portfolio	Both	A written BTC-core / XRP-sleeve architecture that harvests asymmetry back into a reserve asset under rules.

2. Why a weekly engine can fit more than one buyer type

- Long-horizon allocators use BTC to improve deployment quality and use XRP as a capped sleeve rather than a conviction roller coaster.
- Hybrid operators use BTC as the destination asset and XRP as a rule-bound amplifier with written defense.
- Active traders use the 1W layer as the high-value state engine above lower-timeframe entries and exits.
- Existing XRP holders use the continuity inputs and tracker to bring an existing sleeve under written control instead of approximating their state manually.

3. When single-product buying is the correct answer

Buying only BTC is rational when the reserve-core job is the whole job. Buying only XRP is rational when your reserve-core policy already exists elsewhere and you only need a cycle sleeve. Buying both is rational only when you want one BTC-first architecture with an optional XRP sleeve and will actually use the transfer rules.

> The bundle should never be sold as “more labels.” It should be sold as better capital architecture.

> Selection becomes easy once the products are framed correctly: BTC is the compounding engine, XRP is the asymmetry engine, and the bundle is the map that keeps them in their lanes.
