

XRP Top/Bottom Indicator Start Here

Version v1.1.0

Use this first

This sheet is for the first 10 minutes, the first week, and the first month. Run the indicator on **BITSTAMP:XRPUSD** on **1W**, keep the base workflow simple, and let the weekly-close process do the heavy lifting.

Indicator page: AZRO Systems — XRP Top/Bottom Indicator (Invite-Only)

Product / access page: AZRO Systems Gumroad

Support: support@azrosystems.com

Default operating model

The sanctioned base workflow

MAJOR BOTTOM → optional RADAR BOTTOM add if reserved cash is still available → trim / tighten on RISK / HIGH RISK → major distribution on RADAR TOP → finish the managed cycle sleeve on MAJOR TOP.

Act on the weekly close. Keep **XRP RISK**, **MAJOR TOP**, **RADAR TOP**, and **MAJOR BOTTOM** active at all times.

Your first 10 minutes

Step	What to do
1	Confirm access on the correct TradingView account.
2	Open BITSTAMP:XRPUSD on the 1W chart using regular candles.
3	Add the indicator and keep the v1.1.0 defaults intact.
4	Create the essential alerts first: XRP RISK, MAJOR TOP, RADAR TOP, and MAJOR BOTTOM.
5	Write the trim ladder and re-risk rules before the next signal appears.

AZRO SYSTEMS

v1.1.0 • Customer Companion

Your first week

- bullet Let the alerts run. Do not spend the first week curve-fitting settings against old history.
- bullet Treat quiet periods as normal. This is a cycle indicator, not a constant-fire signal feed.
- bullet Ignore EARLY and LIGHT by default unless you intentionally enabled them and understand their trade-offs.
- bullet If a health banner appears, wait for a clean weekly close instead of forcing interpretation through degraded data conditions.
- bullet Journal the current plan: target size, reserve cash, trim ladder, and what would count as a rule violation.

What is normal vs what needs attention

Category	How to interpret it
Normal	Long quiet stretches; RISK without an immediate top; RADAR TOP before MAJOR TOP; EARLY appearing and disappearing by close; optional outputs staying quiet for weeks.
Needs attention	Wrong timeframe, synthetic candles, missing named conditions in alerts, persistent health warnings, or changed settings after alerts were already created.

Important TradingView behavior

Keep alerts aligned with the chart

Indicator alerts depend on the chart interval used when the alert is created, and alerts keep using the settings that existed when they were created. If you later change indicator settings, recreate the affected alerts so the live alerts match the live chart.

First month priorities

- bullet Keep the process simple: weekly chart, regular candles, named alerts, written playbook.
- bullet Refine execution discipline before refining settings.
- bullet Use spot-first structures unless you already understand the cost, liquidation, and behavioral risks of leverage.
- bullet Separate any untouchable long-term core from the actively managed cycle sleeve.
- bullet Review the main guide after the first few weekly closes and then keep the Quick Reference and Weekly Close Checklist nearby.
